Hostel management system
Mar 2026

The “Hostel Management System” is a software application designed to automate and streamline the administrative operations of a hostel. Traditional hostel management methods rely heavily on manual record-keeping, which is time-consuming, error-prone, and inefficient. This project aims to develop a centralized digital system that simplifies tasks such as student registration, room allocation, fee management, attendance tracking, and complaint handling.The system provides an intuitive interface for both administrators and hostel residents. Administrators can efficiently manage room availability, assign rooms, monitor occupancy, and maintain student records. It also enables secure storage and quick retrieval of data, reducing redundancy and improving accuracy. For students, the system offers features such as viewing room details, submitting complaints, and tracking fee payments.The proposed system enhances operational efficiency, minimizes paperwork, and ensures better data management through the use of modern technologies such as databases and web-based interfaces. Additionally, it improves transparency and communication between hostel authorities and resident. Overall, the Hostel Management System serves as a reliable, scalable, and user-friendly solution that modernizes hostel administration and contributes to better resource utilization and management.

STACKIPEDIA
Nov 2025

Stackipedia is a web-based learning platform created to guide students and technology enthusiasts through various technology stacks in a structured and engaging manner. The platform functions like an online shopping website where learners can browse through different “stacks” such as Front-End Development, Back-End Development, Artificial Intelligence & Machine Learning, Blockchain, and more. Each stack card displays its name, logo, difficulty level, and duration required to learn. On clicking a card, users can access detailed information, including setup and installation steps, documentation links, learning roadmaps, applications, GitHub repositories, and certification course links. The goal of Stackipedia is to simplify the learning process by centralising resources that are often scattered across the internet. The platform also allows users to create a wish list of stacks they plan to learn and track their learning journey. With an attractive, dark-themed interface and interactive navigation, Stackipedia creates a unique learning experience that feels like “shopping for knowledge” — an Amazon-like experience for technology education.

SKILLS

- Python
- C Programming
- Frontend development

EXTRA CURRICULAR ACTIVITIES

- Assisted the Recruitment Committee in organizing and coordinating activities during Incridea 2026

ADDITIONAL DETAILS

- • Secured a CGPA of 9.2 in the First Year of B.Tech in Computer Science and Engineering (CSE).

- • Successfully completed the "Python for Everybody" certification course on Coursera. • Completed "AI Basics" and "AI Advanced" courses through Microsoft Azure.
